

How to Prepare a 303 High Tech Fabric Guard™ Demo

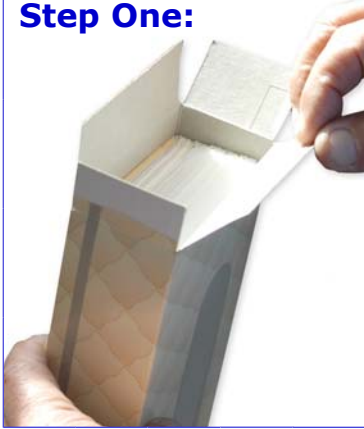

303 High Tech Fabric Guard™ is a consumer's best choice to create and maintain water repellency and to protect textiles against soiling and both water and oil-based stains.

We have found one of the most effective ways to demonstrate the incredible water repellency of 303 High Tech Fabric Guard is to treat a box of highly absorbent facial tissues and use these in an actual demonstration.

Below are the steps to create an entire box of partially treated demo tissues.

Step One:

1). Open one side of a standard facial tissue box.

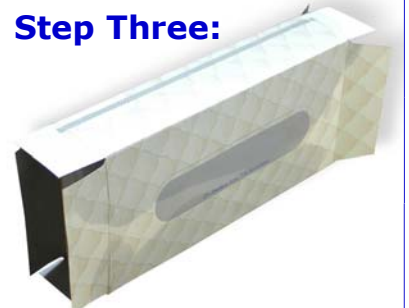

2). Pour in 4 ounces of 303 High Tech Fabric Guard to soak this end of the box.

Step Two:

3). Open the other end of the box and the box at the top and let air dry for 48 hours or longer...until the characteristic odor is gone. When dry, close both ends of the box with Scotch Tape and mark the box "Treated" or "Demo"

Step Three:

How to Demonstrate

1). Take a single tissue from the box.

2). Use a plastic flip-top squeeze bottle with water. Squeeze water drops onto the tissue held at an angle.
